

Welcome to the BHSA App

App Security

The App Offers 4 levels of security

QR Code & Link

Restrict content to approved users

Push Notifications to known users

Full Log into the App each visit

QR Code & Link

The first level of security is the app can not be found anywhere online unless they have access to either the:

- Hunt's App QR code or
- the App's unique URL link.

The app is not referenced or logged by Google or any of the other search engine

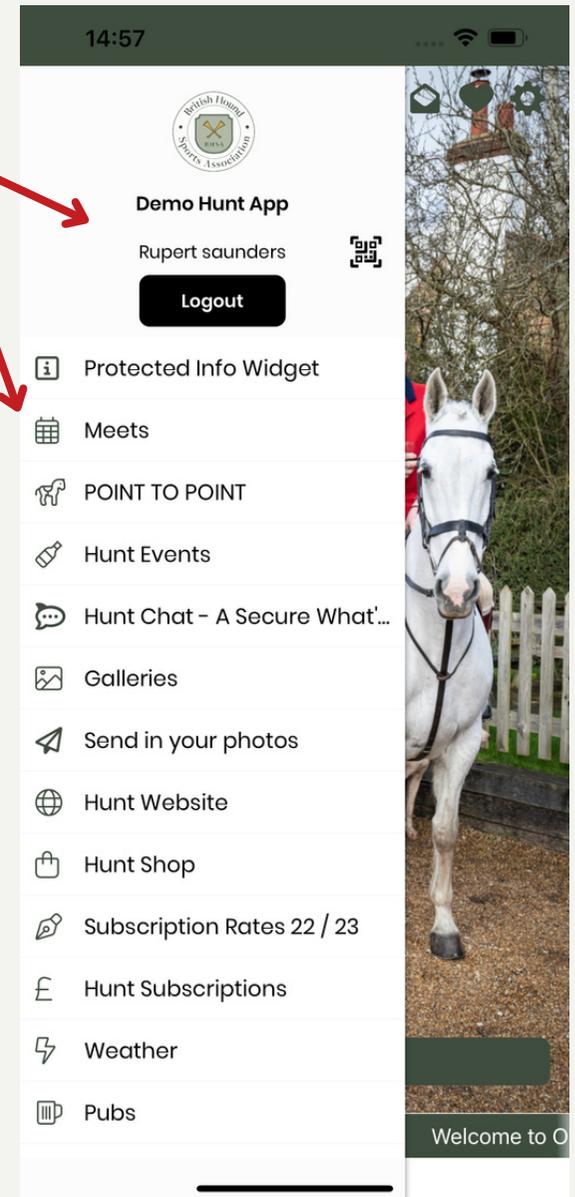

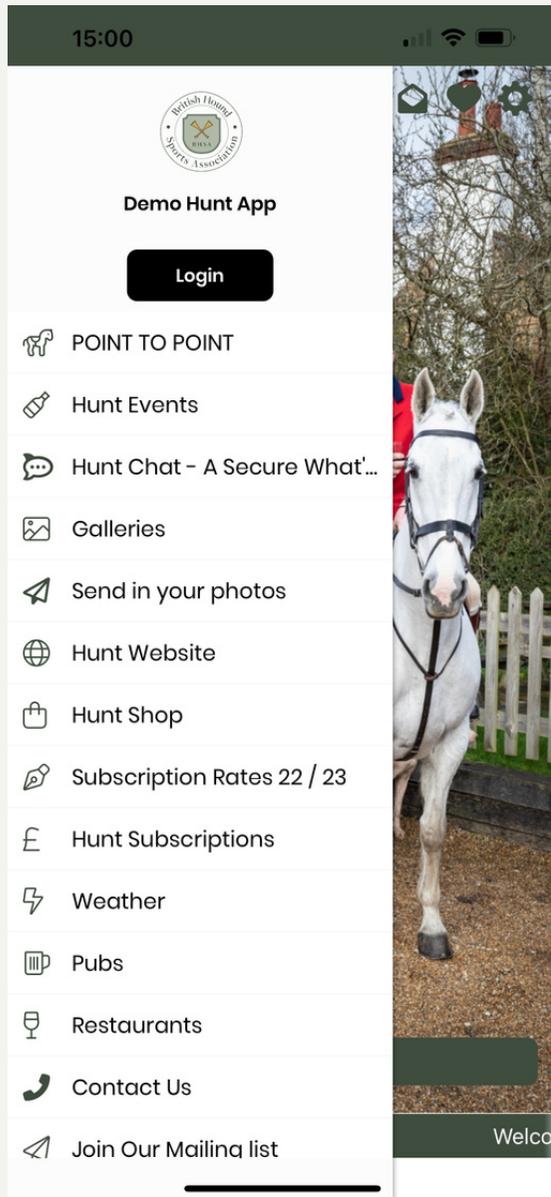

Restrict content to approved users

The Second level of security is to restrict sensitive information to approved users.

Users set up an account in the app and the App Manager decides whether to approve the user or not.

Widget Protection

Only approved users see sensitive content

Push Notifications to known users

A fantastic way of controlling the distribution of important information is to limit sensitive communications to Push Notifications.

Our system allows the App manager to set up different Push Notification Groups (e.g. Hunt Committee, members, visitors, etc.).

Group Members can be scrutinised before being added to a list ensuring total security for the information being distributed

Users can be included in some or all lists depending on their status within the Hunt

Full Log into the App each visit

For Hunts that want total control of their content, the Hunt can manage all user access, with a simple password that can be changed regularly.

Each time the user opens the app they must enter the password to gain access to the App.

Please note this can be quite a disruptive solution for users but it's there if you need it.
